Problems

Problems

✓ Implemented!

Button with a notification. I largely plan on this being present on the 'Problems' button; there is currently no way for someone to know if there is an issue with there code unless it is:

1. Explicitly stated by Braindead in the code, which is only done when illegal syntax has been written (which I think is fair; I don't want to obstruct the user's vision if I can help it)

2. They navigate to the 'Problems' screen.

I also didn't want to include an iOS-style circle-with-a-number above the button as it would not fit with the flat layout of the application.

I have settled on the idea of the button changing to signficantly brighter colours. The background brightens up and the text changes to pure white. This has high contrast - as did the original (WCAG AA+) - but is more attention grabbing due to the uncharacteristic saturation of the colours. The text 'Problems' also changes depending on the severity of the issue(s).
